genes themselves and the encoded proteins. The prokaryotes used are genes themselves and the encoded proteins. The prokaryotes used are genes themselves and the encoded sureus, Salmonella typhi, Klebsiella predemoniae, Pseudomonas aeruginosa and Enterococus facealia. The promotion is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organism. The present sequence represents an essential prokaryotic cellular proliferation protein.

Conce: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The protection of yourt and cheese.

Production of yourt and cheese.

Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-07-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

cerevisiae Selected Interacting Domain (SID (RTM)) proteins and coding sequences. The protein complexes of S. cerevisiae are useful in drug development, in screening drugs or agents that medulate the interaction of proteins, for developing yeast strains with better secretion yield of protein, and in gene therapy. The protein complexes, polypeptides and polynucleotides are useful for preventing or treating Candida infection, cancer or neurodegenerative diseases in humans or animals. The present sequence is a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           61

                 The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacterium coryneform bacterium coryneform bacterium and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly L-lysine. The present sequence is a protein described in the exemplification of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office.

metabolism and oxidative phosphorylation (SMP) proteins given in AAB79243 to AAB 79633 which are involved in carbon metabolism and caidative phosphorylation (SMP) proteins given in AAB79243 to AAB 79633 which are involved in carbon metabolism and energy production. The C. glutamicum SMP gene can be used in vectors (II) for expression in host cells and production or modulation of production of fine chemicals, such as, an organic acid, a proteinogenic or nonproteinogenic amino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleoside, a lipid, a saturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a cofactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins (C [III) encoded by them are used for diagnosing the presence or activity of corraining them are used to map genomes of organisms related to C corraining them are used to map genomes of organisms related to C containing them are used to map genomes of organisms related to C containing them are used to map genomes of organisms related to C containing them are used to map genomes of organisms related to C containing them are used to map genomes of organisms related to C containing them are used to map genomes of organisms related to C c glutamicum, identify and localise C glutamicum sequences of interest, c revolutionary studies, in determining SMP protein regions required for metabolism of sugars, and in modulating high-energy molecule production in a cell (i.e. ATP, NADPH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       60 ILGCDIAGTVVKLGPNASTDLKVGDTGFGPVHGASQTDPKNGAFABYARVYPPLFYKSNL 119

The invention relates to identifying target proteins (ABB90790-ABB94016) for harbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value sequences are selected. The polypoptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are
                                                                                                                                                                                                                         Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
                                                                                                                                                                                                                                                                          Claim 5; SEQ ID NO 2125; 261pp + Sequence Listing; English
                     active polypeptide SEQ ID NO 2125.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and agequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising ancleotide of the invention, methods of producing the novel polypeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             haematopoieeis regulation; tissue growth; immunomodulator; activin; inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; matestasis; cancer; tumour; haematopoietic disorder; proliferation; matestasis; cancer; tumour; haematopoietic disorder; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; oconary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; cell culture; drug screening; gene therapy; antiinflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vascuropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer.

antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the bind to polypeptides of the invention and we handlogy to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may that arise arise is stem cell growth factor activity; the invention may differentiation activity; itsue growth activity; the member activity; the member activity; the member activities; hemostatic or chemokinetic activity; tisue growth activity; the member activities or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include conditions e.g., by protein or gene therapy. Such conditions and conditions e.g., by protein or gene therapy. Such conditions are useful for preventing, treating or amelorate disease, proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, proliferative retinopathy, atherosclerosis, coronary heart disease, promote cell scowth. For example, such polypeptides may be used to promote wound repair (or nucleic acids encoding then may be used to promote cell growth. For example, such polypeptides may be used to augment or temmune disease or accidental damage. The polypeptides and nucleotides may also be used to augment or resplace cells damaged by illnes, autoimmune disease or accidental damage. The polypeptides and in the disease or accidental damage. The polypeptides and in the disease or accidental damage. The polypeptides and in the disease or accidental damage. The polypeptides and in the disease or accidental damage. The polypeptides and in the disease or acciden

ToxD, a gene cloned from a HC-toxin producing strain of Cochliobolus

"ToxD, a gene cloned from a HC-toxin biosynthesis.";

Submitted (CT-1995) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: UNIQUE TO ISOLATES THAT MAKE THE CYCLIC PEPTIDE HC-
TOXIN, BUT HAS NO ROLE IN TOXIN BIOSYNTHESIS.

-!- SIMILARITY: BELONGS TO THE YCRI02C/YLR460C/YNL134C FAMILY.

-I- FUNCTION: DOES NOT HAVE ALCOHOL DEHYDROGENASE ACTIVITY. BINDS NADP AND ACTS TRROUGH A ONE-ELECTRON TRANSPER PROCESS.

ORTHOQUINONES ARE THE BEST SUBSTRATES. MAY ACT IN THE DETOXIFICATION OF XENOBIOTICS.

-I- CATALYTIC ACTIVITY: NADPH + quinone = NADP(+) + semiquinone.

-I- SUBUNIT: HOMOCETAME.

-I- SUBUNIT: HOMOCETAME.

-I- SUBCELLULAR LOCATION: Cytoplasmic.

-I- SINILARITY: BELOIGS to the zinc-containing alcohol dehydrogenase.
                                                            01-OCT-1994 (Rel. 30, Created)
01-OCT-1994 (Rel. 30, Last sequence update)
28-FEB-2003 (Rel. 41, Last annotation update)
Quinone oxidoreductase (EC 1.6.5.5) (NADPH:quinone reductase) (Zeta-Crystallin).
                                                                                                                                                                                                                                                                                        Homo sapiens (Human).

SUBCELLULAR LOCATION: Cytoplasmic.
SIMILARITY: Belongs to the zinc-containing alcohol dehydrogenase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       differential screening.";
Biochem. Biophys. Res. Commun. 219:795-799(1996).
-!- FUNCTION: DDES NOT HAVE ALCOHOL DEHYROCGENASE ACTIVITY. BINDS NADP AND ACTS THROUGH A ONE-ELECTRON TRANSFER PROCESS.
ORTHOQUINONES ARE THE BEST SUBSTRATES. MAY ACT IN THE DETOXIPICATION OF XENOBIOTICS (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: NADPH + quinone = NADP(+) + semiquinone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            "Molecular characterization of seizure-related genes isolated by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           177;

Identification by extrachromosomal amplification and overexpression
of a zeta-crystallin/NADPH-oxidoreductase homologue constitutively
of a zeta-crystallin/NADPH-oxidoreductase homologue constitutively
of a zeta-crystallin/NADPH-oxidoreductase homologue constitutively
Mol. Blochem. Parasitol. 66:201-210 (1994).
-!- CATALYTIC ACTIVITY: NADPH + quinone = NADP(+) + semiquinone.
-!- SIMILARITY: Belongs to the zinc-containing alcohol dehydrogenase
family. Quinone oxidoreductase subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  KHINAYTKIVTVASKKHEKLLKSYGADDVPDYHDAGVIEQIKSKYPNLQHVIDAVGSEDS 250
